

NDN Application Development

Lessons Learned & Next Steps

NDN Community Meeting

October 28-29, 2021

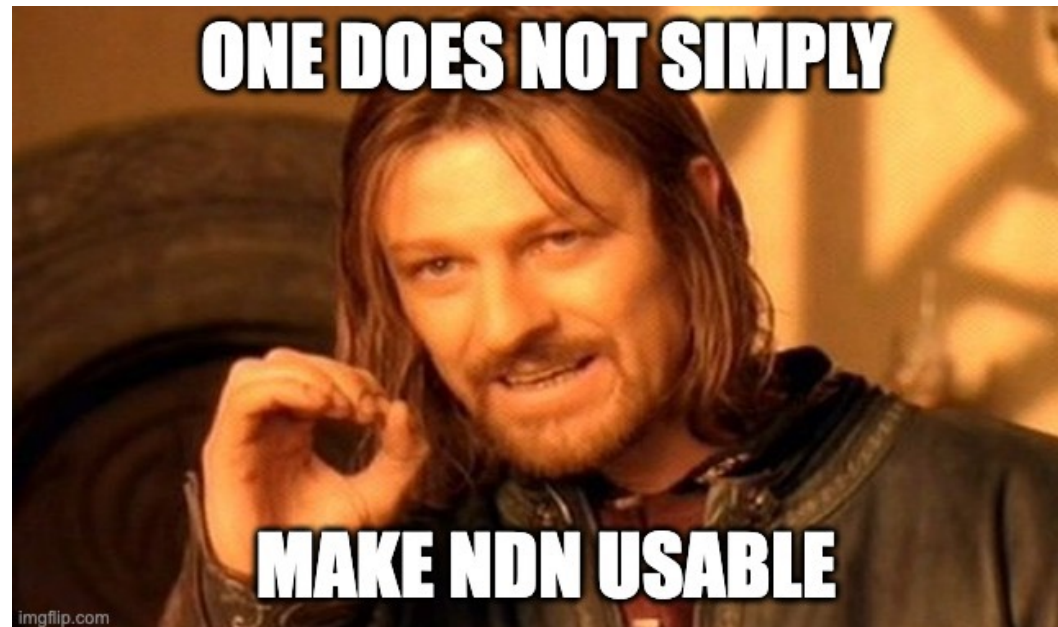

Panelists

- **Kathleen Nichols** (Pollere, Inc.)
- **Peter Gusev** (UCLA REMAP)
- **Marcin Spoczynski** (Intel)
- **John DeHart** (Washington University in St. Louis)
- **Xinyu Ma** (UCLA)
- **Alex Afanasyev** (Florida International University)

Moderator: **Davide Pesavento** (NIST)

Why bother with this panel?

- Developing a non-trivial app that leverages NDN's core features (name-based communication, data-centric security) is *still* challenging
- A simple wish: make NDN more **usable**, improve the **developer experience**

Panel directions

- What are the major pain points in the current NDN software ecosystem (from an application developer's POV)?
 - Recurring issue or missing functionality in the codebase
 - Poor abstractions, unfriendly APIs
 - Missing tool
 - Complicated configuration/deployment
- How can we improve the developer experience in these areas?
- **Goal:** Distill and prioritize the feedback into a list of action items that can help the NDN community plan future improvements to enhance productivity and attract new developers
