

NDN needs “a Cover with Large Friendly Letters”

Kathleen Nichols

Community needs to be welcoming to those with problems to solve and provide clear usage examples

Proposal: NDN should provide an inviting platform to solve problems that are difficult to solve with connection/end-point oriented networking

- Instead of NDN theory and architecture, the platform should feel welcoming to non-network experts, perhaps choosing a small set of Use Cases to show how they are implemented in NDN and include the code. Examples could be a small sensor network, a limited home IoT network, a meeting/lecture platform, etc.
- “What can this approach do for me and how do I use it?”

Suggestion:

- Use cases should be easy to follow with examples that a developer could easily alter to try our solutions for their problems
- For each use case there might be a contact for faculty member(s) whose research groups are working with or interested in those sorts of applications

- This website and/or github repo would be geared to technical people with problems that are difficult to wedge into end-point abstractions, need security and are able to operate in isolation from ordinary IT needs
 - Applications with constrained communication patterns could be a good match for NDN
 - Maybe a use case with NFN
 - Might also be useful for non-networking graduate students
 - This should be separate from the presentation of architecture information about NDN as a Future Internet
- To make this work, the Community needs to think about providing APIs for common communication models (pub/sub, streaming, transaction) that are easy to use without detailed knowledge of NDN “plumbing”

Suggestion:

- Use cases should be compelling and easy to follow with examples that a developer could alter to try out solutions for their problems
- For each use case there might be a contact for faculty member(s) and/or research groups working with or interested in those classes of applications
