# Empower Developers by High-Level Library

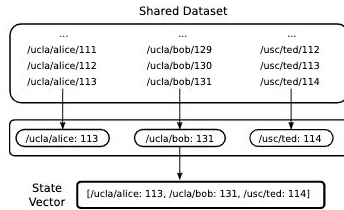

NDN Community Meeting  
Xinyu Ma  
<xinyu.ma@cs.ucla.edu>

---

---

# We have lots of good ideas

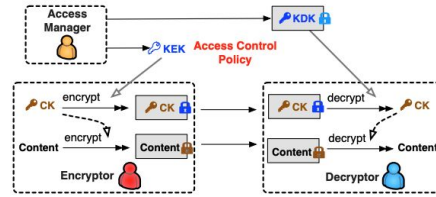

## Sync

## SVS

A sync protocol,  
Can support  
pub-sub

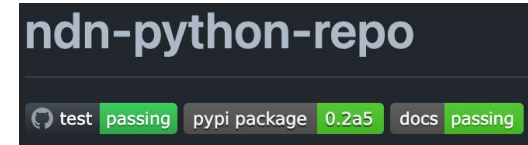

## Security

## NAC

Access control

## Storage

## ndn-python-repo

An NDN data  
storage

# What if we put them together

- Common *interfaces* so different ideas/designs can be used together in one project.
  - Can be a single high-level library, but need to be *flexible* enough

## A Flexible Framework/Library

That those ideas/algorithms/designs can fit in as a component/module.

*Not a requirement, but rather a plan for python-ndn*

# Why I believe this is possible

- A set of **similar functionalities** emerged over time
  - Sync, Trust management, Access Control, Repo, Stream,...
- Data are organized by semantic **names**
  - So should programming (see CNL)

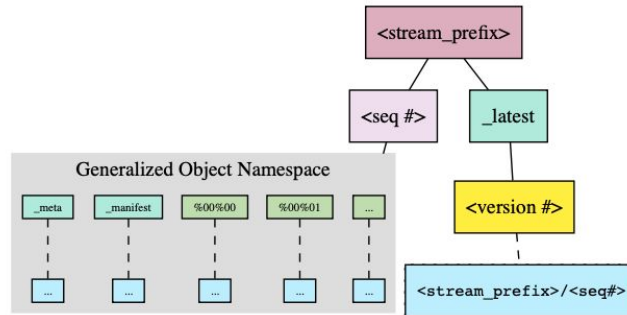

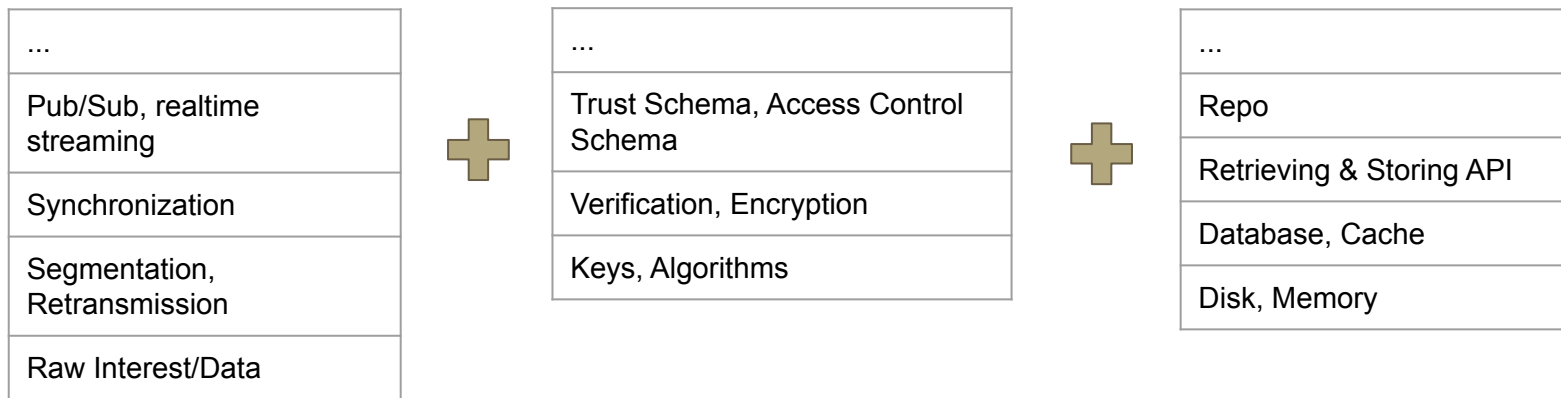

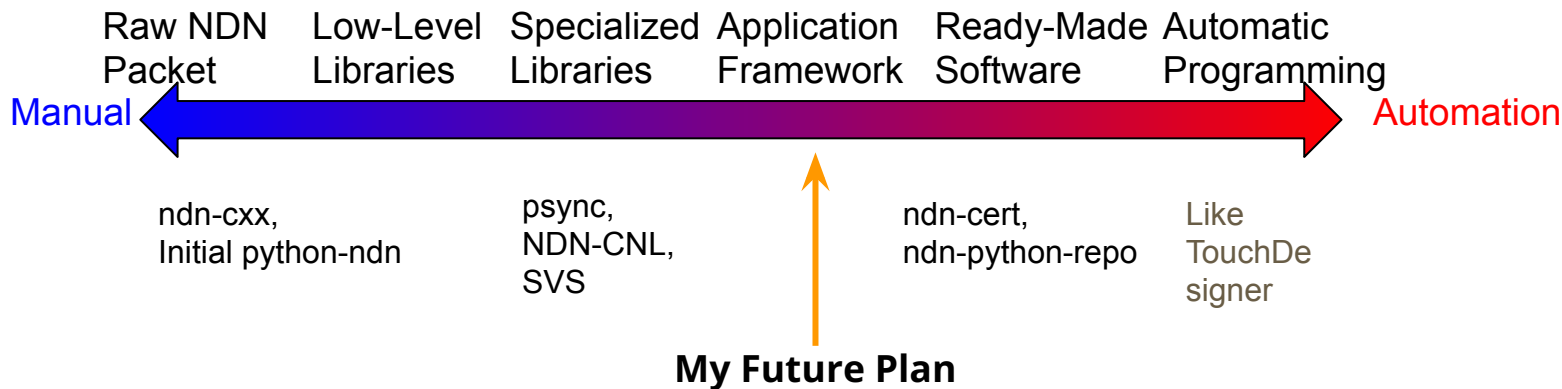

Figure 3: Generalized Object Stream Namespace

# Why this is possible

- A set of **similar functionalities** emerged over time
  - Sync, Trust management, Access Control, Repo, Stream,...
- Data are organized by semantic **names**
  - So should programming (see CNL)
- Jeff's 3S: Sync(transportation), Security, Storage are basically **orthogonal**

# Talk is cheap

- Python-ndn's [schema](#) part has some very basic implementation towards this direction
  - To be refactored/rewritten in near future (2022)
- A GO library is under development

*And of course, maintenance of existing code*
